

Australia - The Bet

Off-grid Cooper Basin compute hub

Working thesis

Archegon develops geothermal-powered data centres - pairing 24/7 firm clean power with AI inference, where the grid cannot reach and intermittent renewables cannot follow.

Route summary

- World-class hot-dry-rock thesis with behind-the-meter, fully off-grid potential.
- Higher technical and development risk, with multi-GW scale headroom if validated.
- Power-stack ownership and optional lithium co-production are research-stage upside themes.
- Best suited to geothermal, infrastructure, energy, and frontier compute partners willing to diligence the resource.

Diligence note

This is a preliminary branded summary created from the current Archegon thesis. Replace it with the founder-approved full business plan before broad investor or partner circulation.
